WHEN TO QUARANTINE

01 The person has NO symptoms
- Fever
- Chills
- Shortness of breath
- Cough
- Diarrhea
- Abdominal pain
- Vomiting
- Fatigue
- Joint pain
- Muscle aches
- New rash
- Loss of smell or taste
- Sore throat
- Headache
- New congestion
- New runny nose

Have they had close contact (<6 ft for 15+ minutes) or been contacted by Public Health and told to quarantine?

02 Close Contact?
- Yes: they have traveled.
  Are they currently on minimal interaction status?
- No: They have not traveled.
  Great! The person does not need to be tested, isolated, or quarantined. A face covering, physical distancing, and all other transmission prevention strategies are recommended.

03 Quarantine at home for 14 days with no in-person contact with others. A negative test cannot shorten a quarantine. If a person starts having symptoms, they should call their doctor and get tested for COVID-19.

04 Returning from Travel
- Yes: They may not attend in-person school, activities, or other school-related in-person events while on minimal interaction status.
- No: They did not get tested (or the adult they traveled with did not get tested) so they are in quarantine status for 14 days.
- No: If it has already been 7 days and their second test at 7-14 days has come back negative, so they are off minimal interaction status. They may resume in-person school and activities. A face covering, physical distancing, and all other transmission prevention strategies are recommended.
